## 1. Job Optimization

	Solution	Time Slot 1	Time Slot 2	profit
	1	Job 1	Job 3	55
	2	Job 3	Job 1	55
	3	Job 2	Job 1	65
	4	Job 2	Job 3	60
(a)	5	Job 4	Job 1	70
	6	Job 4	Job 3	65
	7	Job 1	N/A	30
	8	Job 2	N/A	35
	9	Job 3	N/A	25
	10	Job 4	N/A	40

(b) The optimal schedule has Job 4 in timeslot 1 and Job 1 in timeslot 2 for a profit of \$70.

(c) A high level greedy algorithm would choose the largest profit with a deadline of 1 or 2, then choose the largest profit with a deadline of 1. In this case, it would choose Job 4, then Job 1.

## 2. Dynamic Programming: Change Making

(a) The minimum number of coins needed to meet the amount is 3.

(b) Minimum coin combinations include {1, 2, 5} and {3, 3, 3}

(c)	n	0	1	2	3	4	5	6	7	8	9
	$f(n)$	0	1	2	1	2	1	2	3	2	3

(d)

```

Change-making(D[j], n):
    f[0] = 0
    for i = 1 to n do
        temp = -1
        j = 1
        while j <= m and i >= D[j] do
            temp = min(f(i-D[j]), temp)
            j = j + 1
        f[i] = temp + 1
    return f(n)

```

## 3. Dyanmic Programming: Knapsack Problem

(a)

(b)

(c)

#### 4. Greedy Algorithm

(a)

(b)

(c)
