Homework Assignment: 2
Name: Jonathan Gaines
Date: 3/29/2017

_____

1. XSort Algorithm

    (a)
$$EXAMPLE \Rightarrow AXEMPLE \Rightarrow AEXMPLE \Rightarrow AEEMPLX$$
$$\Rightarrow AEELPMX \Rightarrow AEELMPX$$

    (b) Time Efficiency: $O(n^2)$
       Space Efficiency:

    (c) Stability in an algorithm refers to the ordering of elements of same values in the
        final sorted list. A stable algorithm will keep elements of the same value in the
        same order as they appeared in the unordered list. This algorithm is stable because
        the only circumstance where elements of a list are swapped is if a value is distinctly
        less than the other value, such as $A < Z$. Because a $\leq$ is not used, elements of
        same values will not be swapped.

2. Bubble Sort

    (a)
$$EXAMPLE \Rightarrow EAMPLEX \Rightarrow AELEMPX \Rightarrow AEELMPX$$
$$\Rightarrow AEELMPX \Rightarrow AEELMPX$$

    (b)

    (c) This sort is stable because the comparison is testing to see if $alist[x] > alist[x+1]$
        rather than $list[x] \geq list[x+1]$. Thus, a swap is only made if element x is larger
        than element x+1.

3. Show that $n^2 \in O(n^2 + 10n), n \geq 0$

       Choose $k = 1$

       because $n \geq 0$, then $\frac{f(n)}{g(n)} = \frac{n^2}{n^2+10n} > \frac{n^2}{n^2+10n^2} = \frac{1}{10}$

       choose $c = \frac{1}{10}$. Note that $\frac{1}{10n} > \frac{1}{10n^2}$

       Thus, $n^2 \in O(n^2 + 10n)$ because $n^2 > \frac{n^2}{10}$

4. Show that $n \notin \Omega(n^2)$

       Choose $k = 1$

       Assuming $n > 1$, then

       $\frac{f(n)}{g(n)} = \frac{n}{n^2} < \frac{n^2}{n^2} = 1$

Choose $c = 1$. Note that $n < n^2$

Thus $n \notin \Omega(n^2)$ because $n < n^2$ when $n > 1$
